

Predicting an NBA Player's Salary

Using Regression Modeling

Is it possible to predict an NBA player's salary based on their game stats? Here we will be utilizing regression modeling to do just that. We'll be iterating through different models through regularization and feature engineering tools to see which will give us the best performance based on R-square values as an indication of accuracy. Then we will test our model and predict salaries that we'll compare to actual salaries to see how our model performs.
